

Experiment No. 6

Aim: To understand the handover mechanism.

Objectives:

To study the effect of handover threshold and margin on SINR and call drop probability and handover probability

Prerequisite:

Operating System: Windows 7

Java Version: 6 only

Mozilla Firefox version: 47.0.1

Theory: Handoff

Consider the figure below Initially say the mobile M is quite close to the base station A and hence receives signal strength from A $P_{Arx} > P_{Brx}$. As the mobile moves away from the base station. A and goes towards B then the signal strength from A keeps falling (pathloss increases). Let there be a minimum sensibility level P_{0rx0} for the mobile, i.e. if the signal from the B.S. to which the mobile is connected falls below P_{0rx0} then the call drops. In order to prevent call drop the mobile monitors receive signal strength from the neighboring 3-6 B.S.. These neighboring 3-6 B.S. also monitor Rx signal strength from the M.S.

The mobile should get connected to B.S. which has the highest signal strength. However, if the M.S. continuously attaches itself to the B.S. with instantaneous highest signal strength then the h/o rate may be very high in some condition.

Thus, some hysteresis condition is used for h. If $P_{Tx}(T = \text{target B.S.}) > P_{rx}h$ higher h/o threshold and $P_{rx}(c = \text{current B.S.}) < P_{rx}h$ minimum h/o threshold then execute h/o to B.S. Thus, it is threshold impeditive to study in part of the handoff process.

$$\Delta\gamma = P_{rx} - P_{rx}\Delta = h$$

A successful handoff is one where the call gets from and continuous without call or in other words the h/o occurs before P_{rx} becomes $< P_{0rx} < 0$. If $P_{rx} < P_{0rx} < 0$ then call drop event occurs.

One would like to minimize the no of handoff events as well as minimize call drop probability. The experiment provides opportunity to study the inherent of these three parameters on h/o.

Further the averaging window for calculating P_{Tx} and P_{rx} also plays a role in the process. In the experiment small scale fading is not considered and hence the averaging considered only shadowing.

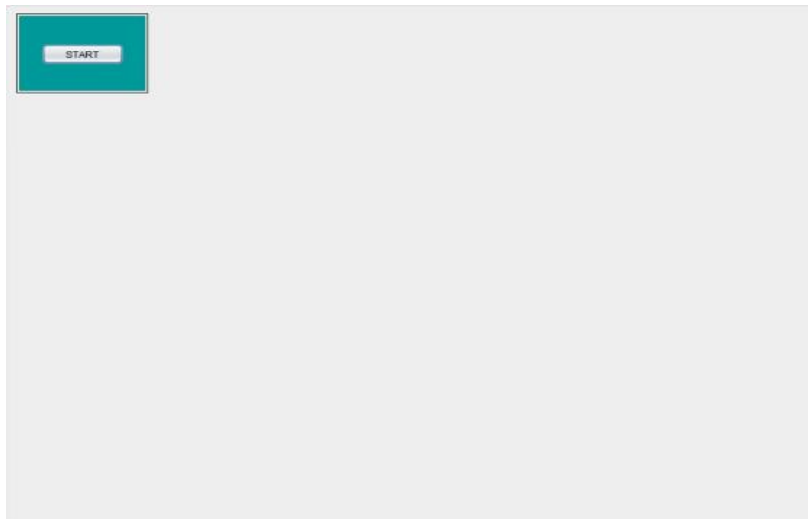

Students conducting the experiment is expected to study the impact of these on h/o. He/She is encouraged to repeat the experiment for several sets of values of these parameters these draw conclusion.

Instruction

Follow the instructions given below to perform the experiments.

1.1 Starting the Experiments: -

- . Step1: Click on START button to start experiment.

- Step2: Enter your name then click OK button.

Step3: Select the parameters (e.g.: Reuse, Environment, Beamwidth, Carrier frequency etc.)

The screenshot displays a network simulation interface. The top left shows a hexagonal grid of cells with green antenna icons and numerical labels (e.g., 3.2, 5.2, 7.2). The top right contains a 'Parameters' panel with various settings. The bottom left shows an 'Observation' panel with a table of results. The bottom right contains a 'Results' panel with summary statistics.

Parameters Panel:

- Environment: 1
- Frequency Reuse: 50
- Horizontal Beam Width of Base Station Antenna: 90
- To Rotate Horizontal Beam: 30
- Beam Tilt angle: 2.2
- Std. Deviation for Shadowing: 4
- Rx and Tx antenna heights: 10
- Noise Figure: 5
- Desired SNR Value: 5
- Value for Avg. Window: 0.1
- Margins for Handoff: 5
- Time allotted for Mobile to move: 20
- Time between 2 readings: 50

Observation Panel:

Name: PRAKASH	SNR(dB)	CallDro.	HOs	Del1	Del2	Time	Leaving	% Outage	alpha
Pr:-14.503623277413954 dBm									
Dist:37.520627549509066 m									
No.Handoffs:0									
No.Calldrops:0									
Time:									
SNR(dB): -7.862096069579078									
Outage Time(ms):									

Results Panel:

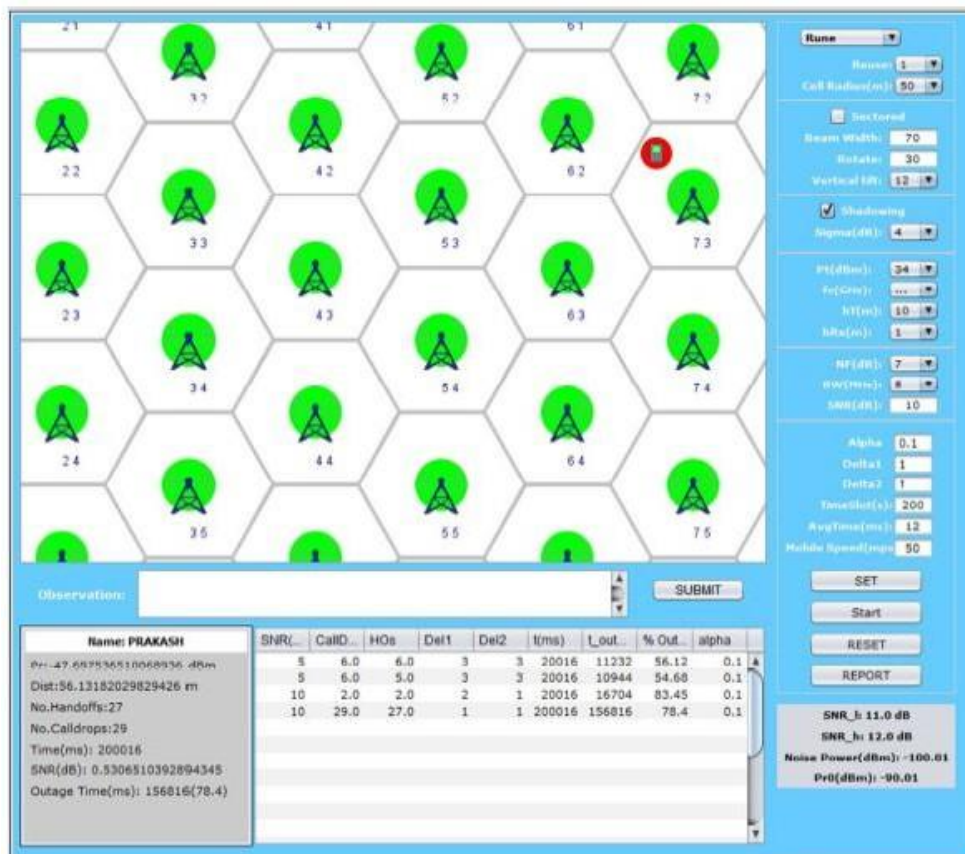

- SNR_i: 11.8 dB
- SNR_i: 11.8 dB
- Noise Power(dBm): -100.01
- Pr0(dBm): -95.81

Buttons: SET, START, RESET, REPORT

Annotations:

- Instantaneous SNR
- Time duration of mobile during which mobile has no connectivity.
- Click this "SET" button to apply any changes that made to the above parameters.
- SNR+Delta1
- SNR_i+Delta2
- Noise Power+SNR

- Step4: Click on START button and observe No. of Call Drops and No. of Handoffs.

- Step5: Enter your observation in the OBSERVATION box and Click on SUBMIT button.
- Step6: Finally, click on REPORT to generate PDF report of the experiment.

- Step7: After PDF report generation you will get following message.

- Step8: PDF report will appear like this.

Fading Channels & Mobile Communications

IIT Kharagpur

Date: 22/Feb/2013

Exp 8: Handoff

Name: PRAKASH

Input Parameters

Reuse: 1	Model: Ruine	Pt (dBm): 34
fc (GHz): 0.8	Beam Width (deg): 70	Cell Radius (m): 50
Rotate (deg): 30	hT (m): 10	hRx (m): 1
Sigma (dB): 4	Vertical Tilt (deg): 12	Band Width (MHz): 5
SNR (dB): 10	Noise Figure (dB): 7	Noise Power (dBm): -100.01
Pr (dBm): -90.01	Time Slot (s): 200	

Exp. Results

SNR	No. Call dr ops	No. Hand offs	Delta1	Delta2	Reading Time (ms)	Outage Time (ms)	% Outage	Alpha
5.0	6.0	6.0	3.0	3.0	20016.0	11232.0	56.12	0.1
5.0	6.0	5.0	3.0	3.0	20016.0	10944.0	54.68	0.1
10.0	2.0	2.0	2.0	1.0	20016.0	16704.0	83.45	0.1
10.0	29.0	27.0	1.0	1.0	200016.0	156816.0	78.4	0.1

Observation

Observation not entered

(Signature of PRAKASH)

(Signature of Faculty)

- Step9: To redo experiment click on RESET button.
- Observation Table:

Reuse	No of Hand Off	Mobile Speed	Outage	Outage Percentage
1				
3				

Keep reuse ratio 3 and set mobile speed to 50 mps and 100 mps and record the below data. Whatdo we observe after increasing the speed of the mobile station?

Reuse	Mobile Speed	No of Hand off	Outage	Outage Percentage
3	50			
3	100			

Conclusion:

FAQ:

1. What is handoff?
2. What is the condition for handoff?
3. Explain Handoff and its types.
